

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

---

1-37. (cancelled)

38. (New) A method for managing resource usage of code downloaded to a computer system, the method comprising:

for each code downloaded to the computer system, associating a resource indicator with all threads that are executed directly by the downloaded code and all threads that are initiated by the downloaded code, wherein all of the threads that are executed directly by the downloaded code and all threads that are initiated by the downloaded code are defined as a set of related code; and

C  
3 updating the resource indicator when the related code increases or decreases its collective resource usage of the particular resource.

39. (New) A method as recited in claim 38 wherein the resource indicator's amount represents an absolute value of the resource usage.

40. (New) A method as recited in claim 38 wherein the resource indicator's amount represents a proportional value of the resource usage.

41. (New) A method as recited in claim 38 further comprising:

associating the related code with each resource portion of the particular resource that is allocated for the related code; and

disassociating the related code with each resource portion of the particular resource that is deallocated for the related code,

wherein the resource indicator is decreased when a resource portion is deallocated and increased when a resource portion is allocated for the related code.

42. (New) A method as recited in claim 41 further comprising:

allocating the particular resource to the related code when the resource indicator is below a maximum predetermined threshold; and

indicating an error and not allocating the particular resource when the resource indicator is above the maximum predetermined threshold.

C  
3  
43. (New) A method as recited in claim 42 wherein the error is indicated by throwing an out\_of\_memory exception.

44. (New) A method as recited in claim 41 wherein the related code is disassociated through a garbage collection procedure.

45. (New) A method as recited in claim 38 wherein the particular resource is selected from a group consisting of memory usage, open file usage, open socket usage, and monitor usage.

46. (New) A method as recited in claim 45 wherein the resource indicator indicates a percentage of the particular resource that is utilized by the related code.

47. (New) A method as recited in claim 45 further comprising:

associating a plurality of thresholds with the particular resource and the related code; and

notifying a registered resource callback when the amount of resource usage of the particular resource by the related code exceeds a first one of the thresholds.

*C*

48. (New) A method as recited in claim 47 further comprising notifying a registered resource callback when the amount of resource usage of the particular resource by the related code drops below a second one of the thresholds that has a different value than the first threshold.

*B*

49. (New) A method as recited in claim 47 further comprising notifying a registered resource callback when the amount of resource usage of the particular resource by the related code drops below the first threshold.

50. (New) A method as recited in claim 38 wherein the particular resource is CPU usage or network usage.

51. (New) A method as recited in claim 50 further comprising:

associating a threshold with the particular resource and the related code; and

indicating that the related code's priority for CPU usage be decreased when the amount of resource usage of the particular resource by the related code exceeds the threshold.

52. (New) A method as recited in claim 51 further comprising:

associating a second threshold with the particular resource and the related code; and

indicating that the related code's priority for CPU usage be boosted when the amount of resource usage of the particular resource by the related code drops below the second threshold.

53. (New) A method as recited in claim 38 wherein the related code is configured to be executed on behalf of an applet in the form of threads.

54. (New) A method as recited in claim 38 further comprising:

associating a plurality of resource indicators with the related code that each indicates an amount of resource usage of a plurality of resources by the related code; and

updating a selected resource indicator when the related code increases or decreases its collective resource usage of the associated resource.

55. (New) A method as recited in claim 54 wherein the resources include memory usage, CPU usage, and network usage.

56. (New) A method as recited in claim 55 wherein the resources further include open file usage and open socket usage.

57. (New) A method as recited in claim 38, further comprising determining which threads are to be defined as the set of related code based on which threads are assigned to a same protection domain.

58. (New) A method as recited in claim 38, further comprising aborting the threads of the related code when their resource indicator exceeds a maximum level.

59. (New) A method as recited in claim 38, wherein the computer system is integrated with a set top box or a navigational system.

60. (New) A computer readable medium containing computer codes for managing resource usage of code downloaded to a computer system, the computer readable medium comprising:

computer code for associating for each code downloaded to the computer system a resource indicator with all threads that are executed directly by the downloaded code and all threads that are initiated by the downloaded code, wherein all of the threads that are executed directly by the downloaded code and all threads that are initiated by the downloaded code are defined as a set of related code; and

computer code for updating the resource indicator when the related code increases or decreases its collective resource usage of the particular resource.

C  
3 61. (New) A computer readable medium as recited in claim 60 further comprising:

computer code for associating the related code with each resource portion of the particular resource that is allocated for the related code; and

computer code for disassociating the related code with each resource portion of the particular resource that is deallocated for the related code,

wherein the resource indicator is decreased when a resource portion is deallocated and increased when a resource portion is allocated for the related code.

62. (New) A computer readable medium as recited in claim 61 further comprising:

computer code for allocating the particular resource to the related code when the resource indicator is below a maximum predetermined threshold; and

computer code for indicating an error and not allocating the particular resource when the resource indicator is above the maximum predetermined threshold.

63. (New) A computer readable medium as recited in claim 60 wherein the particular resource is selected from a group consisting of memory, open files, open sockets, and monitors.

64. (New) A computer readable medium as recited in claim 63 further comprising:  
computer code for associating a plurality of thresholds with the particular resource and  
the related code; and  
computer code for notifying a registered resource callback when the amount of resource  
usage of the particular resource by the related code exceeds a first one of the thresholds.

65. (New) A computer readable medium as recited in claim 63 further comprising computer  
code for notifying a registered resource callback when the amount of resource usage of the  
particular resource by the related code drops below a second one of the thresholds that has a  
different value than the first threshold.

3  
66. (New) A computer readable medium as recited in claim 60 wherein the particular  
resource is CPU usage or network usage.

67. (New) A computer readable medium as recited in claim 66 further comprising:  
computer code for associating a threshold with the particular resource and the related  
code; and  
computer code for indicating that the related code's priority for CPU usage be decreased  
when the amount of resource usage of the particular resource by the related code exceeds the  
threshold.

68. (New) A computer readable medium as recited in claim 67 further comprising:  
computer code for associating a second threshold with the particular resource and the  
related code; and

computer code for indicating that the related code's priority for CPU usage be boosted when the amount of resource usage of the particular resource by the related code drops below the second threshold.

69. (New) A computer readable medium as recited in claim 60 wherein the related code is configured to be executed on behalf of an applet in the form of threads.

C  
3

70. (New) A computer readable medium as recited in claim 60, further comprising computer code for determining which threads are to be defined as the set of related code based on which threads are assigned to a same protection domain.

71. (New) A computer readable medium as recited in claim 60, further comprising computer code for aborting the threads of the related code when their resource indicator exceeds a maximum level.

72. (New) A computer readable medium as recited in claim 60, wherein the computer system is integrated with a set top box or a navigational system.
